

Interview questions and answers

1. What problem do you want this software to solve?
2. Who are the main people who will use the software?
3. What should a user be able to accomplish with the system?
4. Can you walk us through how you currently handle this process without the software?
5. What are the most important features the software needs to have?
6. Are there different types of users, such as administrators, employees, customers, or students?
7. Should different users have different permissions or access levels?
8. Will users need to create accounts and log in?

Yes to make friends and have them to keep coming back.

9. What information does the system need to store about users or other records?

User names, pictures for avatar

10. Should users be able to create, edit, delete, or search for information?
11. Does the system need to send emails, notifications, reminders, or alerts?

Send and receive messages from friend and system for the event.

Messages is only when they log in.

Friend requests

12. Does the software need to generate reports or statistics? If so, what information should they show?

Yes

win/loss percentages

Chips

Help people make bets and make it optional for beginners.

13. Does the system need to upload, download, or store files or images?

Upload image as avatar

14. Does the software need to connect with any existing systems, websites, databases, or APIs?

Able to connect to google

15. What should happen when a user makes a mistake or enters invalid information?

Message display

16. What tasks should only an administrator be allowed to perform?
17. What information should users see when they first open the application?

Have a lobby and whats going on and any active tables and give the ability to create a new table and give the ability to make privates room

List of tables

Make bet limits

18. Are there any features that would be useful but are not absolutely required?
19. Are there any features you specifically do NOT want included?
20. Will the software primarily be used on computers, phones, tablets, or all three?

website.

21. How many people do you expect to use the system?
22. Are there security or privacy requirements we should know about?

Have system admin that manage accounts and game chats to senor chats and make disclaimer message. User can message admin to report a problem.

You can have taunts.

23. How fast should important actions or pages respond?

Count down timers for actions 10 to 15 seconds. If they fold there hand 5 times in a row then kick thim out of the table.

24. Are there accessibility requirements we should consider?
25. Should the system keep a history of changes or user activity?
26. What information should be searchable, sortable, or filterable?

Friend list

Tables

stats

27. **What would make you consider the finished software successful?**
28. **Which features are the highest priority for the first version?**
29. **Can you describe a typical scenario of someone using the software from beginning to end?**
30. **Is there anything important about the system that we haven't asked about?**

Look up game rules.

Company name stack over flow web app of card game name of the game is 7 stud.

Game deal 2 card at beginning face down and money in the middle. Bet chips that they have. Deal face up card 3 cards one face down and 2 face up.

Run ads and canicos place holder

Ad revenue

Get all game functions to work.

Make like www.playwsop.com

Can play as a guest but don't get chips or retain stats.

Color skeme is purple.

Have ads at the tables every 5 minutes.

Make logo and company is called stack over flow chip making company

Recover password for google account or email

For everyone no age limit, and a tutorial at the beginning. Practice with bots

Have level of difficulty for bots and the box don't earn any chips or stats

Be online

Leaderboard that rewards top players per week or per month and who every wins get bonus chips or prizes

Make as social as possible.

Ben's notes:

Head of mechanic dept

- needs web app, stack overflow
- make a web app for a card game name is 7 stud, look up rules Its a real card game, deals 2 cards at the beginning face down
- Everyone needs to put money in the middle
- Just to come and play for fun and no real money. Chips
- Everyone then gets dealt a face up card
- Can play as a guest, but also can save as an account to accumulate chips and make friends
- Goal is to get the name of the company out there and run ads on this web app casinos
- Stack overflow is stacking chips
- for now have placeholders for ads. But we will use ads to generate revenue
- Ads for more chips
- Work on better animation later, like playwsp design is
- Use their google account to authenticate their account
- If play as guest they dont accumulate any chips\
- accounts shows stats like how often do they fold, win percentage, data storage and more. Shows improvement
- Premade avatars or let them upload their own pictures
- Send and receive messages from friends. Notifications when logged in will show events coming up in the game
- Joining friend's tables
- Add different settings to the games to allow beginners to understand whether their hand is good
- user can report people to admins if they break rules in chat
- Banning times depend on the policy we want to set
- Company color is #bf40bf purple
- Company name displayed throughout the app
- We should design a logo, they are a chip making company
- Probably a stack of chips going through a cloud
 - Surprise him
- if a player doesnt act then they forfeit their hand
- if 5 times they are kicked form the table
- email ahead of time if we need to show him something
- Run on their servers eventually
- Use localhost for deployments
- Have forget password option that sends email to them
- No age limit
- Make a tutorial
- Practice with bots
- Add bots to real games. Add bots to player games is possible
- Leaderboard to show highest win rate, highest chips
- Highest chips per month/week get additional prizes
-

Clean Summary of client requirements

Client Requirements Summary – Stack Overflow Poker Web Application

Project Overview

The client wants a web-based Seven-Card Stud poker application for a poker-chip company called Stack Overflow. The primary purpose of the application is to let users play poker online using virtual chips only, while promoting the company and encouraging users to return through accounts, statistics, friends, social features, leaderboards, and eventually advertising. The client emphasized that the first priority is getting the core poker game working correctly; more advanced visual effects and animations can be developed afterward.

The application should primarily be designed as a desktop/browser-based website, although making it usable through a mobile browser would be beneficial. The finished application will eventually need to be deployed online rather than operating only through localhost.

Users and Accounts

The system will have three main user types: registered users, guests, and administrators.

Registered users should be able to sign in using their Google account, maintain a profile, accumulate virtual chips, retain gameplay statistics, add friends, and interact socially with other players. User profiles should include at least a username and avatar/profile image, with either preset avatars or an uploaded image.

Guests should be allowed to immediately play without creating an account. However, guest users should not accumulate permanent chips, retain statistics, or receive the full account/social benefits available to registered players.

Administrators should have elevated permissions to manage the application, monitor active tables and chats, investigate user reports, and take disciplinary actions when necessary. Depending on the seriousness of an issue, administrators should be able to remove a player from a table or temporarily/permanently restrict their access.

Poker Gameplay

The primary game will be Seven-Card Stud poker. The development team should research and implement the established rules of Seven-Card Stud, including dealing cards, antes, betting rounds, folding, calling, raising, and determining the winning poker hand. The client specifically instructed the team to look up the complete game rules rather than relying solely on the abbreviated explanation provided during the interview.

Players will use virtual poker chips, not real money. Each table should support configurable game settings such as the ante and betting limits. The system must manage the deck, cards, player turns, bets, pots, folds, and determination of the winning player.

For beginners, the client would like an optional assistance feature that can indicate the strength of the player's hand and help them understand their betting situation. Experienced users should be able to disable this assistance.

Lobby and Poker Tables

When users enter the application, they should see a casino-style lobby showing available and currently active poker tables. Users should be able to browse tables, join an available table, or create a new table.

Tables should support both public and private games. Private tables should allow users to play with invited friends. When creating a table, users should be able to configure appropriate game settings such as the ante and betting limits.

The client referenced the interface of WSOP's online poker experience as inspiration for the general table/lobby experience, rather than requiring an exact copy.

Social Features

The client wants the application to be as social as possible. Registered users should be able to add friends, receive friend requests, see friends online, determine which table a friend is playing at, and potentially join that table.

Users should also be able to send and receive messages while logged into the application. System announcements, such as information about events, should appear inside the application rather than being dependent on external email notifications.

Poker tables should include communication between players, such as table chat and potentially predefined taunts/reactions.

Statistics and Player History

Registered accounts should retain gameplay statistics so users can track their performance over time. The system should track information such as:

- Wins and losses, win/loss percentage, virtual chip balance, hands played, betting behavior, folding/calling behavior, and other useful poker statistics.
- Users should be able to access their own statistics and gameplay history. Guests will not retain these statistics.

The client would also like a leaderboard showing high-performing players, potentially organized weekly or monthly. Promotions could reward leaderboard players with bonus virtual chips or other prizes, providing an incentive for users to return.

Bots, Tutorials, and New Players

The application should be approachable for people who have never played Seven-Card Stud. The client requested a tutorial that teaches users how the game works.

Users should also be able to practice against computer-controlled bots. Bots may have different difficulty levels and may also be used to fill tables when there are not enough human players available. Bots should not earn permanent chips or player statistics.

Advertising and Virtual Chips

The application will eventually be monetized through advertising, particularly advertisements related to casinos or other relevant organizations. Initially, placeholder advertisements can be used while the main system is being developed. Ads may appear around poker tables approximately every five minutes.

A future feature could allow users to voluntarily interact with or watch advertisements in exchange for bonus virtual chips. There should be no real-money gambling or purchasing system in the initial application.

Administration, Moderation, and Security

Administrators should be able to monitor the system, including games and player communications. Users should have a way to report inappropriate behavior or other problems to an administrator. Administrators should then be able to review relevant chat/activity records and determine an appropriate response.

Players should receive a disclaimer or code-of-conduct message explaining appropriate behavior. Depending on violations, moderation actions could include removing someone from a table or suspending/banning the account.

Authentication should use Google authentication, reducing the need for the application to maintain its own password system.

Performance and Error Handling

Because poker is played live between users, actions need to occur quickly. Players should have approximately 10–15 seconds to make an action during their turn. A player who repeatedly fails to participate or automatically folds approximately five consecutive hands may be removed from the table so inactive players do not prevent others from playing.

When invalid information is entered, the system should display a clear error message explaining that something went wrong. Searches that have no matching results can simply display no matching results.

Visual Design

The primary company/application color should be purple. The client currently does not have a finalized logo and is open to the development team designing one. One concept discussed during the interview was a stack of poker chips incorporated with imagery related to the name Stack Overflow.

The first version does not need highly advanced animations. The priority should be making the game functional, followed later by enhancements such as card-dealing animations, improved table graphics, and other visual effects.

First-Version Priorities

For the initial working version, the development team should prioritize correct Seven-Card Stud gameplay, virtual chips and betting, user/guest access, Google authentication, the lobby and tables, multiplayer gameplay, basic profiles/statistics, and reliable real-time interaction. Social features, bots/tutorials, moderation, leaderboards, advertising, and advanced graphics can then build upon that foundation.

Overall, the client's vision is an online, social Seven-Card Stud poker platform using virtual currency, designed to attract people to the Stack Overflow poker-chip brand and encourage users to repeatedly return, play with friends, improve their poker skills, and interact with the community.
